Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

• *Proposed Solution*

Date	30 September 2026	**Team ID**	SWTID-2026-2123
Project Name	Standard Laptop Order Automation	**Platform**	ServiceNow Flow Designer

2. Proposed Solution Template

The provided template asks for six parameters: problem statement, idea/solution, novelty, social impact/customer satisfaction, business model, and scalability. □ □ □ □

S.No.	Parameter	Project-specific response
1	**Problem Statement**	The IT procurement process for standard laptops has manual overhead. Configuration tasks can be delayed or missed, increasing user wait time and reducing procurement efficiency.
2	**Idea / Solution Description**	Implement a ServiceNow Flow Designer flow named “Standard Laptop Task”. When the Service Catalog process reaches the configured trigger, the flow creates a Catalog Task for the Requested Item, sets the description to “Laptop need to Configured”, assigns it to the Hardware group, and requires Approval = Approved. The flow is then attached to the Standard Laptop catalog item.
3	**Novelty / Uniqueness**	The solution uses workflow automation to connect an approved standard-laptop request directly to the hardware configuration task, reducing the need for manual task creation and assignment.

4	**Social Impact / Customer Satisfaction**	Employees receive a smoother laptop-provisioning experience with less waiting. IT staff spend less time on repetitive administrative work and can focus on configuration and service delivery.
5	**Business Model (Revenue Model)**	This is primarily an internal IT process-improvement solution rather than a direct revenue-generating product. Its business value is realized through reduced manual effort, improved resource utilization, fewer process errors, and faster service fulfillment.
6	**Scalability of the Solution**	The same Flow Designer pattern can be extended to other standardized IT catalog requests by changing triggers, catalog items, task descriptions, assignment groups, approvals, and downstream actions. It can therefore serve as a reusable automation pattern for IT procurement and service fulfillment.
